Washington, D. C.

October 16, 1942

FARM WAGE RATES
CONTINUE TO RISE

Farm wage rates on October 1 were the second highest on record, the U. S. Department of Agriculture reported today. The index, at 220 percent of the 1910-14 period was the highest since 1920.

The October 1 figure represents an 18-point rise since the last quarterly report on July 1. Usually there is no seasonal change from July to October. The index is also 57-points above October 1, 1941. This is the greatest increase ever recorded within a year's time.

Monthly wage rates including board increased between July 1 and October 1 in all sections of the country. Gains over October 1, 1941, ranged from 21 percent in the South Atlantic States to 52 percent in the Pacific States, where rates around \$90 were reported.

The average rate per day without board, \$2.75, was up 31 cents since July and up 72 cents since the previous October. Increases, noted in all States except Vermont, were generally greater in States west of the Mississippi than in those to the east.

Supply and Demand Data Now Published in Index Form

The supply of and demand for farm labor are being presented for the first time in the form of indexes, that is, the current reported averages are expressed as percentages of base period figures. The quarterly reported data for the years 1935-39 were used in determining the base averages. This is a rather recent period and one for which more factual information of all kinds is available than for some earlier periods that might otherwise have been adopted. An index, of course, simply registers relative change. This is precisely the reason farmers are requested periodically to report on the supply and demand situation in their respective communities--to furnish their idea of the changes which have occurred. A comparison of the current year's index with that for the previous year provides an indication of the year-to-year change, as well as the change from the base period. It is obvious, of course, that no numerical significance can be attached to the indexes, that is, it is not possible to apply these figures to some enumerated or estimated number of workers to arrive at a numerical increase or decrease in farm labor supply or demand.

Farm Labor Supply Smallest on Record

The index of farm labor supply of 54 for October 1942 indicates the sharp reduction in available farm labor supply at current wage rates, compared with that obtainable during the period 1935-39. It is a decline of 16 points from the supply index for the same date in 1941, and 8 points below the July index of this year. The supply indexes

show some variation over the country with the highest indexes shown in the South Atlantic and East South Central States, and the lowest indexes in the Mountain area and in the West Coast.

Opening of schools during the past month and further inroads by urban employment and the armed services have contributed to the problems of obtaining sufficient workers. With fall harvesting in full sway in most communities, farmers are having to make the most strenuous efforts to accomplish the necessary work. Careful planning of farm work, efficient and extensive use of available machinery, more exchange of labor than customary in the past, and the help of women and older men, have aided in saving many crops and accomplishing other work which might otherwise have been left undone. The magnitude of the task confronting farmers is augmented by the record breaking proportions of this season's crop and livestock production.

The index of demand of 125 for hired farm labor is 8 points above that for October last year, and is 4 points above the index for July 1942. An index 25 points above the base period (1935-39) reflects the relative change in the demand for workers at current wages, compared with the demand for workers during the base period at wages then prevailing. For past years demand for farm labor is closely correlated with cash farm income and the present high level of demand may be an indication of the cash income now being secured by farmers. The demand indexes range from 116 in New England to 139 in the West North Central division.
